## SEED - *Ubuntu20.04.zip*

I downloaded version 6.1.16 Windows 10 Oracle VirtualBox and added the SEED-Ubuntu20.04 hard disk file. I then made a new Machine using this tutorial provided by the SEED website [seed-labs/manuals/vm/seedvm-manual.md](https://seed-labs.github.io/manuals/vm/seedvm-manual.md) at master · seed-labs/seed-labs · GitHub.

I ran into this error when attempting to boot this machine. I then attempted to run the VM in CMD to get a more detailed error. It's throwing VERR\_SUP\_VP\_NOT\_SIGNED\_WITH\_BUILD\_CERT (-5657). Considering the error thrown I'd have to assume this is a version mismatch? Regardless I attempted to reinstall the hard disk file with a new machine and the same error is still thrown.

I'm not entirely sure from what angle to approach this error; there's another version of Vbox that works with this VDI. Or that I might need an extension package for VBox. I'll try to make a fix and if I am successful I will resubmit the assignment.
